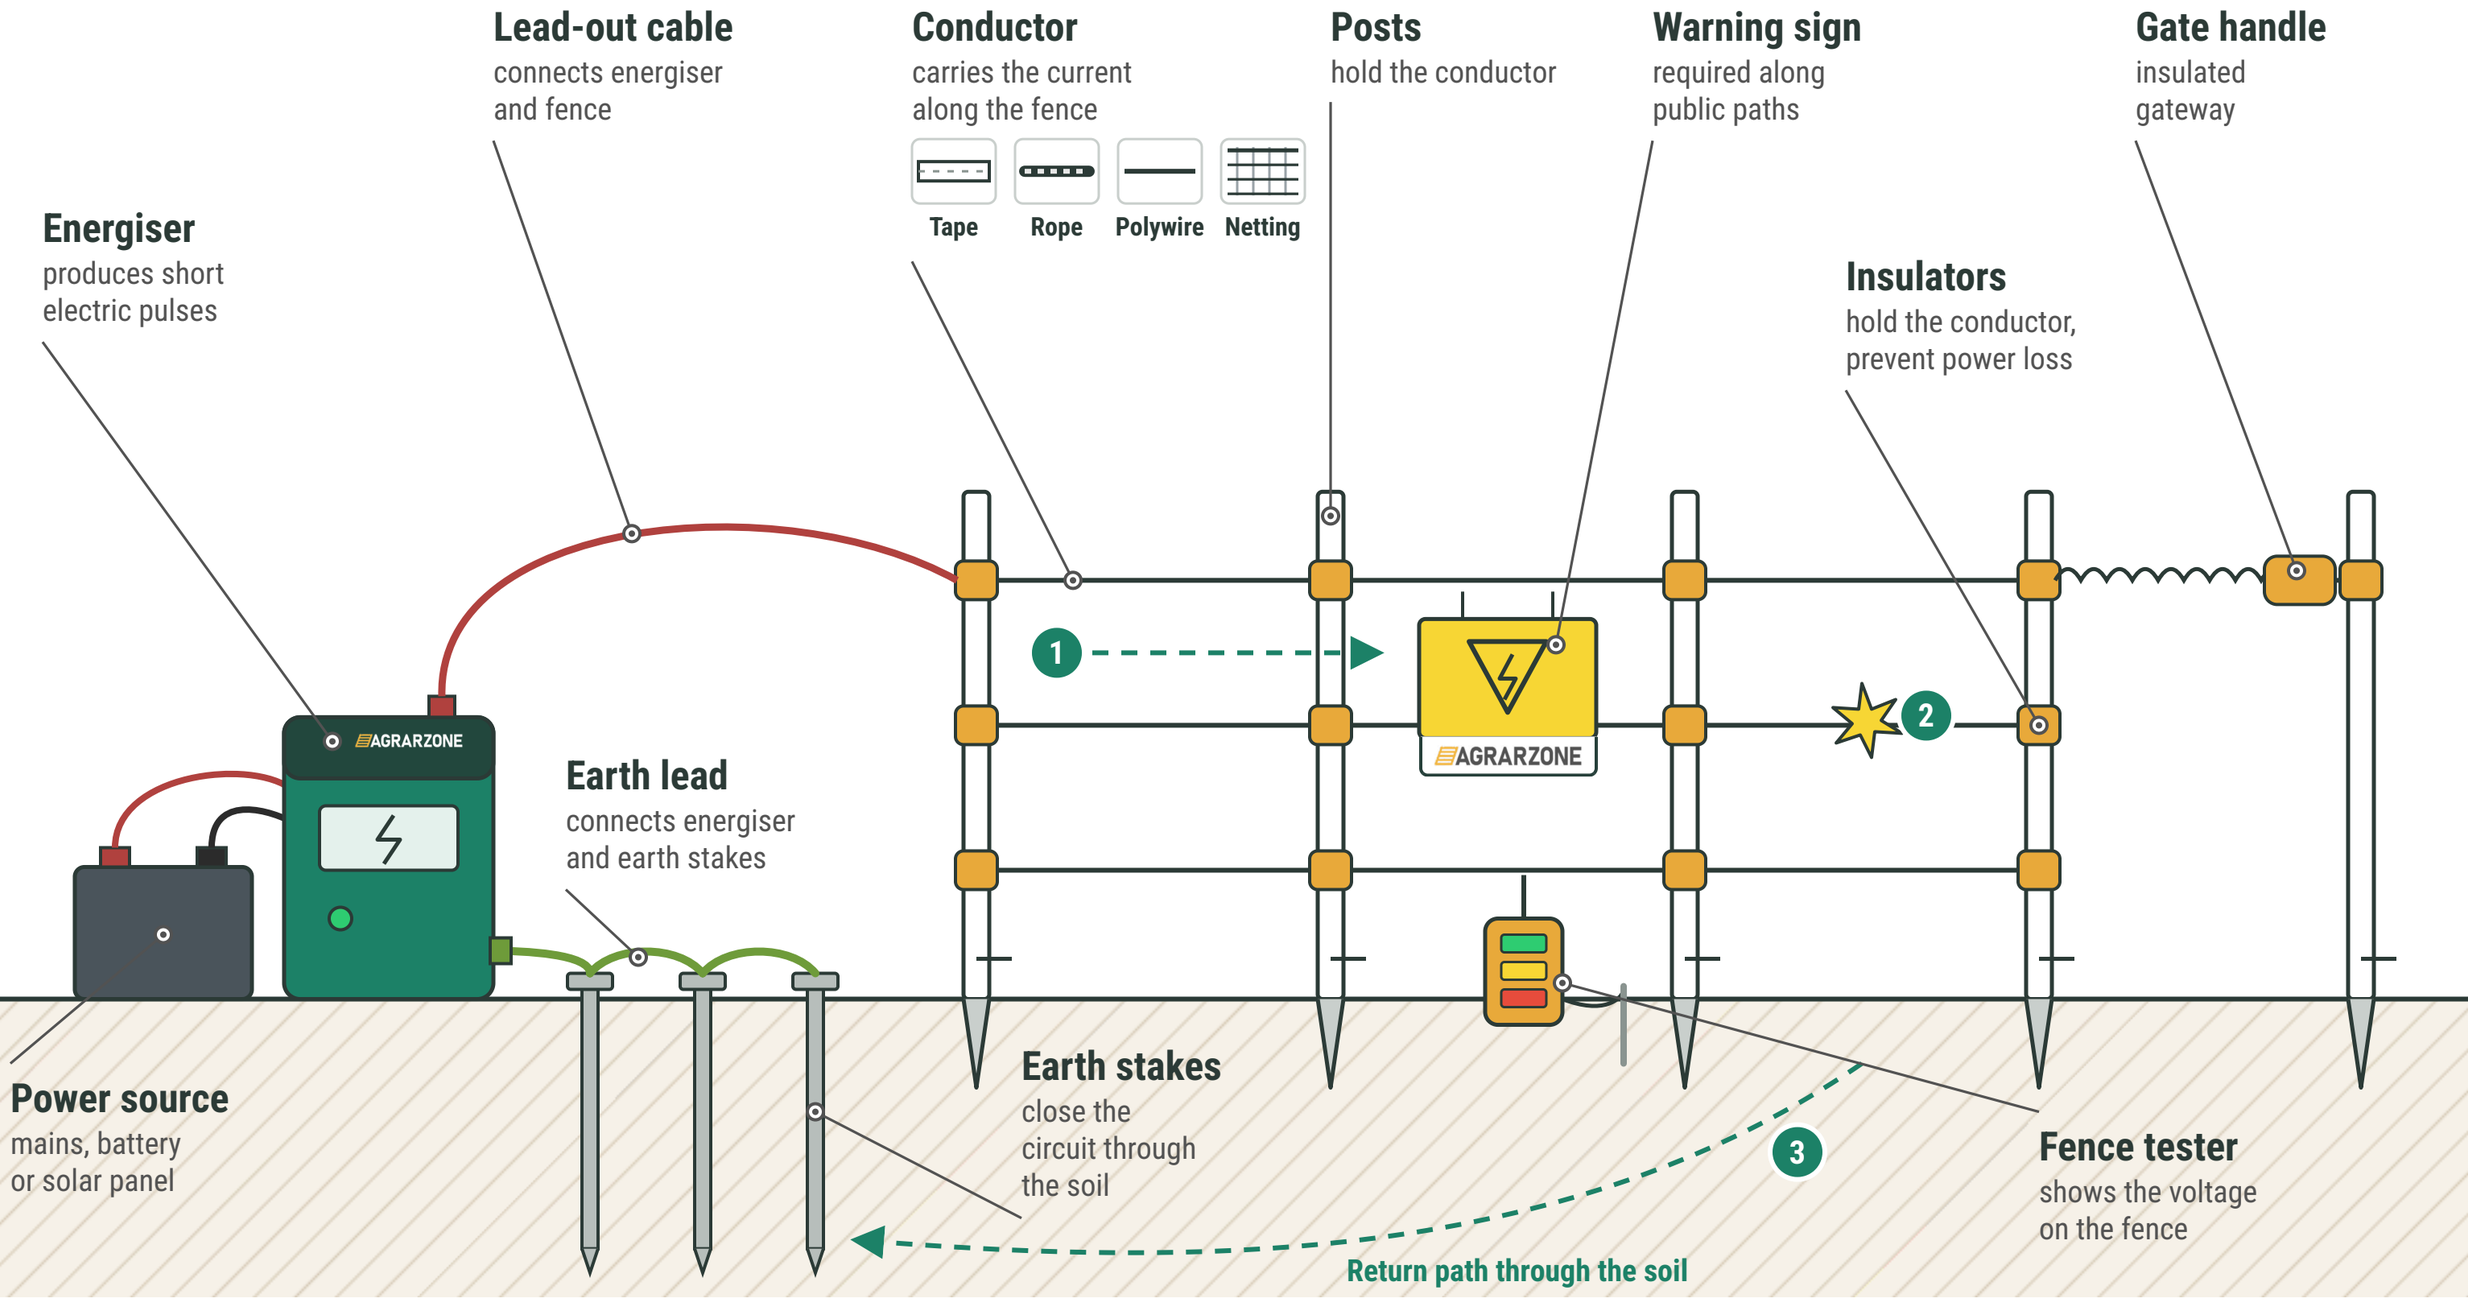
What do you need for an electric fence?

AGRARZONE

BASIC PRINCIPLE



The basic principle

Every electric fence needs an energiser, a conductor and an earth system.
What your fence looks like exactly depends on the animals and the use, for example with tape, polywire or netting.

1. The energiser sends short electric pulses into the conductor.
2. When an animal touches the fence, the current flows through the animal into the ground.
3. Through the earth stakes it flows back to the energiser. The circuit is closed and the animal feels a short, harmless shock.
